School of Computing, Engineering, and the Built Environment
Edinburgh Napier University

PHD STUDENT PROJECT

Funding and application details

Funding status: Self-funded students only

Application instructions:
Detailed instructions are available at https://www.napier.ac.uk/research-and-innovation/research-degrees/how-to-apply

Prospective candidates are encouraged to contact the Director of Studies (see details below) to discuss the project and their suitability for it.

Project details

Supervisory Team:
- DIRECTOR OF STUDY: Dr Viviani Onishi (Email: V.Onishi@napier.ac.uk)
- 2ND SUPERVISOR: Dr Nazmi Sellami

Subject Group: Engineering & mathematics

Research Areas: Engineering - Mechanical Engineering and Chemical Engineering

Project Title: Optimising Renewable Energy-Driven Zero-Liquid Discharge Desalination Systems

Project description:
Zero-liquid discharge (ZLD) desalination systems have recently emerged as a promising solution for dealing with water scarcity worldwide. ZLD desalination systems are high-recovery processes that allow the production of valuable freshwater and salt with (near-)zero-waste generation. Thus, ZLD desalination reduces the environmental pollution related to brine disposals in ocean or surface water bodies. Although widely recognised as a sustainable process for improving water supply sources, the implementation of ZLD desalination systems is still limited by their intensive energy consumption and high associated processing costs.

Still, since both thermal and electric power used in desalination systems are usually produced from fossil fuel energy sources, the elevated energy consumption related to ZLD systems is also responsible for significant pollutant emissions to the atmosphere. Carbon footprint and other air pollutant releases directly (e.g., thermal sources such as steam) or indirectly (e.g., energy from electricity grids) associated with ZLD schemes can be mitigated by developing higher energy efficiency technologies and incorporating renewable (e.g., solar, wind, and geothermal energy) and low-grade energy sources.

Within this framework, this project is aimed at developing new systematic modelling approaches for the optimisation of renewable-based ZLD desalination systems. The optimisation models will be mainly based on mathematical programming techniques, including deterministic and/or stochastic optimisation. The main objectives include developing useful tools to support the decision-making process towards implementing more cost-effective and environment-friendly ZLD desalination systems.

The PhD student will be supported through periodic meetings with the supervisory team and trained on technical relevant skills such as writing research articles for publication and presenting at international conferences.

Candidate characteristics

Education:
A second class honour degree or equivalent qualification in Mechanical Engineering or Chemical Engineering

Subject knowledge:
- Thermodynamics and Applied Mathematics

Essential attributes:
- Experience in fundamental research analysis skills
- Competent in mathematical modelling using MATLAB
- Knowledge of fundamental energy transfer processes
- Good written and oral communication skills
- Strong motivation with evidence of independent research skills relevant to the project
- Good time management skills

Desirable attributes:
- Knowledge of mathematical programming in GAMS software
- Experience using Engineering software tools and process simulators (Aspen Hysys, TRNSYS, etc.)
