

VEGOGRAPH

Vegograph is an interactive food calendar which encourages the consumption and production of local and seasonal food. In its standby mode it shows the user a selection of vegetables which are ready to harvest in the current months.

It also functions as a database of tutorials on how to grow different vegetables and through Arduino technology it can teach the user how to plant a certain plant in an interactive way. The user can take the tag, which is used to label a plant, put it in the vegograph and it will show him all the information he needs.
